AmpleHarvest.org – Defining The Difference

AmpleHarvest.org – Introduction

AmpleHarvest.org is a non-profit organization that runs a 50 state hunger/food waste program of the same name.

AmpleHarvest.org looks at hunger and food waste through a different lens to focus on the abundance of surplus food grown by 42 million home and community gardeners nationwide.

It built a nationwide public awareness program and a customized search engine to enable growers to act on the information, thus establishing without the need for storage, refrigeration, or logistics, a way for millions of Americans in need to get freshly grown food.

AmpleHarvest.org is a technology based, cost efficient, brick-and-mortar free solution to hunger/food waste and diet-related disease. With AmpleHarvest.org, the cost of the food as well as the logistics of warehousing and moving it, the two most costly parts of traditional food programs, vanish as the gardeners grow, harvest and transport the food themselves. This scalable solution does not incur the historically large costs of any other food program. The result is an extremely high ROI that is unmatched by any other similar non-profit.

AmpleHarvest.org has decentralized the food donation process by bypassing the regional Feeding America food banks entirely - with the full support of Feeding America and the food banks themselves - effectively “flattening” the supply chain. The AmpleHarvest.org solution engages legacy resources – America’s home and community gardeners plus the existing national food pantry network, and links them through a custom food pantry search engine to do what the centralized food bank network has been unable to do – utilize locally grown fresh food.
In short, AmpleHarvest.org works because it leverages both the pent up supply of food as well as grower goodwill. According to a recent Cisco Systems analysis, once both are unleashed, growers are likely to continue donating their surplus produce for the rest of their gardening lives, which makes AmpleHarvest.org's impact systemic and sustainable.

AmpleHarvest.org – What it isn’t?

1. **It is not a food pantry/bank program**

AmpleHarvest.org does not feed people directly. Food pantry/bank type programs are in a never-ending costly loop of securing funding, acquiring (typically processed) food and then distributing the food. Rinse and repeat. While they do feed people, but they do not address underlying any root-cause issues. AmpleHarvest.org is instead a program that taps into the passion of tens of millions of gardeners who have always hated wasting their surplus food, and connects them with one of nearly 9,000 local food pantries eager for that surplus. This pipeline assures that the food gets to a hunger/feeding program without AmpleHarvest.org actually “touching” the food. Most importantly, it permanently solves the two information problems of gardeners who thought they could not donate fresh food, and food pantries that did not know that this food was freely available to them.

2. **It is not a traditional food recovery program**

AmpleHarvest.org does not actively recover (i.e. pickup and transport) surplus/unused food from gardens, stores, restaurants, or farmers markets. However, many of these food recovery programs rely on AmpleHarvest.org’s search engine to help them do their work. These programs are logistics heavy meaning the cost of running these programs as well as the difficulty in building and managing a team of volunteers prevents them from scaling. Lastly, as conventional programs require teams of volunteers vs. AmpleHarvest.org’s use of the individual gardener, AmpleHarvest.org is the only program with social distancing built into the solution.
3. **It is not a gardening program**

AmpleHarvest.org does not set up gardens nor teach people how to garden. Other programs, such as the Master Gardener program, do an excellent job of helping new gardeners learn how to garden. AmpleHarvest.org steps in after that point.

4. **It is not a food drive**

AmpleHarvest.org is not a collection point to which people can bring food (especially purchased food) for redistribution to food programs. Rather, it enables growers to directly donate their surplus harvest to a local pantry as soon as its been harvested, and at a time that is convenient to the grower and on a date and time shortly before the pantry clients pick up food. This eliminates any need for refrigeration and storage. Furthermore, the fact that food travels from the donor (gardener) to the hungry family (by way of the local food pantry) in hours guarantees that the food will be “garden fresh” by the time it reaches the family.

5. **It is not a peer to peer “food sharing” program**

AmpleHarvest.org does not facilitate nor encourage people “sharing” food with strangers. While these programs do reduce the waste of food, they generally do not benefit hungry families. Plus there is no legal protection for the donors.

6. **Nor is it a gleaning program**

AmpleHarvest.org does not focus on farms where organizations bring in volunteers to harvest left over food. It is instead focused on home/community gardeners that grow food for personal use. Note: Given the current crisis experienced by farmers during the COVID-19 crisis, AmpleHarvest.org has been able to slightly reposition itself to help smaller family farms that were unable to bring their harvest to the market, to be able to donate it instead.
AmpleHarvest.org – What Is it?

It is an incredibly simple solution to hunger and food waste based on the idea that the problem isn’t the food itself, but rather misinformation and missing information.

The AmpleHarvest.org program is a tech-based solution to a nationwide problem most people never knew about: the waste of over 11 billion pounds of surplus harvest from America’s home and community gardens. This ending the waste of this locally grown fresh food could dramatically decrease problems of hunger and malnutrition.

Until now, there has been no way to supply locally grown fresh produce into the food pantry network because the food bank network’s hub and spoke design prevented acceptance of this food. The legacy system buys/collects packaged food, moves it to a centralized location (a regional Feeding America food bank), and then delivers it to pantries. The refrigeration, special trucks, and timely delivery required to supply fresh produce has been impossible under this model.

The AmpleHarvest.org model solves the problem by enabling gardeners to find local pantries to which they can deliver their own surplus harvest year after year. By “überizing” or flattening the process, the freely available food travels the least distance in the shortest possible time, to a food pantry within the community.

Harvesting and transportation of the food to the pantry is done by the gardener and the ultimate distribution of the food to hungry families remains with the food pantry.

This simple solution addresses:

- Hunger
- Food Waste
- Malnutrition including diet related diseases
- Climate change and the waste stream
AmpleHarvest.org – Extreme Efficiency

As an information based program, it incurs nearly none of the costs typically associated with traditional hunger relief programs:

1. It does not have to buy food because the food already exists in the community
2. It does not have to ship food because the grower transports the food directly to the local food pantry
3. It does not have to refrigerate food because the harvesting, transporting and ultimate distribution of the food all takes place on a same day/next day basis
4. It does not have to maintain office space in the communities it serves because the technology provides the necessary ubiquity
5. It does not have to hire local staff because the work of growing, harvesting, and delivering is largely performed by both the grower and the pantry staff.

AmpleHarvest.org – A Scaled Viral Solution

Because AmpleHarvest.org operates as a cloud based solution, it is able to scale to any community in “real time”. As of mid 2020, nearly 9,000 food pantries in 4,200 communities in all 50 states have joined AmpleHarvest.org with more signing up daily.

Once a food pantry registers, it can start receiving food from nearby growers as soon as it verified by AmpleHarvest.org’s staff.

In addition to AmpleHarvest.org promoting the program nationwide through social and traditional media and byway of a massive Google marketing grant, posters and boilerplate press releases are provided to each food pantry to help them promote it locally.

Additionally, as each gardener learns about their capacity to donate their surplus bounty to a nearby food pantry, they tend to share the news with neighboring gardeners, who inturn themselves start sharing it further.

Like lighting one match in a pack of matches, it quickly spreads.
To better understand the impact of this scaling, a team from the Harvard Business School Alumni Association in early 2020 created a tool to illustrate the impact of this one of a kind solution.

For example, a one time $100 donation to AmpleHarvest.org results in 206 lbs. of food donated the first year. Because more growers learn from each other that they can donate, the second year, 278 lbs are donated, and this increases annually.

![Impact of Donations to AmpleHarvest.org](image)

By the 20th year, 107,273 lbs worth $148,517 will have been donated! This tool is publically available at [www.AmpleHarvest.org/impact](http://www.AmpleHarvest.org/impact). Feel free to explore it.

With a donation to a conventional hunger/food waste program, most of the money is applied towards acquiring and distributing the food. Once consumed, the impact of that donation ends. More money is needed to acquire and distribute more food.

With a donation to AmpleHarvest.org, most of the money is applied towards connecting more growers to more food pantries. And as that happens, growers increasingly share this new donation opportunity with neighboring growers, creating an ever expanding impact.

**AmpleHarvest.org – The End Game**

Ultimately, the future has all gardeners in America knowing about their opportunity to donate their surplus harvest to a nearby food pantry, and all food pantries in America being visible and accessible to any nearby gardener eager to donate their surplus harvest.

AmpleHarvest.org will never “end hunger”. For one thing, no one grows corn flakes or bread in their back yard. The American food bank system will always need a supply of commercially produced food to help sustain hungry families. Additionally, most gardeners can’t grow/harvest in the winter months.

What AmpleHarvest.org can and ultimately will do is assure that America will make the best possible use of all of the freely available, surplus locally grown fresh food growers are eager to donate, to help nourish neighboring hungry families, as long as hunger exists.
